or equivalently:

$$\begin{pmatrix} X \\ Y \\ Z \end{pmatrix} = \begin{bmatrix} \Lambda \end{bmatrix}^T \begin{pmatrix} x \\ y \\ z \end{pmatrix} = = \begin{bmatrix} \hat{x} & \hat{y} & \hat{z} \end{bmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix}$$

where X/Y/Z are global coordinates, x/y/z are local coordinates, $\hat{\Lambda}$ is the DCM from global to local, and $\hat{x}/\hat{y}/\hat{z}$ are the unit vectors of the local coordinate system expressed in the global coordinate system.

$$\begin{cases} \theta_{x} \\ \theta_{y} \\ \theta_{z} \end{cases} = F^{Euler Extract} \left(\left[\Lambda \left(\theta_{x}, \theta_{y}, \theta_{z} \right) \right] \right)$$

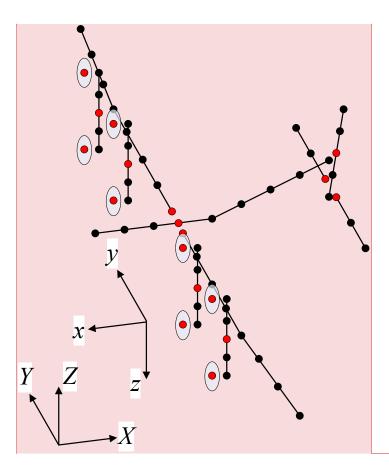

where function $F^{\textit{EulerExtract}}(\)$ returns the 3 Euler angles of the x-y-z (1-2-3) rotation sequence used to form Λ (that is, first a rotation θ_x about the global X axis, followed by rotation θ_y about the Y' axis, followed by rotation θ_z about the Z'' axis) defined as follows:

$$\begin{split} &\Lambda\left(\theta_{x},\theta_{y},\theta_{z}\right) = \begin{bmatrix} COS\left(\theta_{z}\right) & SIN\left(\theta_{z}\right) & 0 \\ -SIN\left(\theta_{z}\right) & COS\left(\theta_{z}\right) & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} COS\left(\theta_{y}\right) & 0 & -SIN\left(\theta_{y}\right) \\ 0 & 1 & 0 \\ SIN\left(\theta_{y}\right) & 0 & COS\left(\theta_{z}\right) \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 \\ 0 & COS\left(\theta_{z}\right) & SIN\left(\theta_{z}\right) \\ 0 & -SIN\left(\theta_{z}\right) & COS\left(\theta_{z}\right) \end{bmatrix} \\ &= \begin{bmatrix} COS\left(\theta_{y}\right)COS\left(\theta_{z}\right) & COS\left(\theta_{z}\right)SIN\left(\theta_{z}\right) + SIN\left(\theta_{z}\right)SIN\left(\theta_{y}\right)COS\left(\theta_{z}\right) & SIN\left(\theta_{z}\right)SIN\left(\theta_{z}\right) - COS\left(\theta_{z}\right)SIN\left(\theta_{y}\right)COS\left(\theta_{z}\right) \\ -COS\left(\theta_{y}\right)SIN\left(\theta_{z}\right) & COS\left(\theta_{z}\right)COS\left(\theta_{z}\right) - SIN\left(\theta_{z}\right)SIN\left(\theta_{y}\right)SIN\left(\theta_{z}\right) & SIN\left(\theta_{z}\right)COS\left(\theta_{z}\right) + COS\left(\theta_{z}\right)SIN\left(\theta_{y}\right)SIN\left(\theta_{z}\right) \\ SIN\left(\theta_{y}\right) & -SIN\left(\theta_{z}\right)COS\left(\theta_{y}\right) & COS\left(\theta_{z}\right)COS\left(\theta_{y}\right) \end{bmatrix} \end{split}$$

Note the following simplifications:

$$\begin{split} &\Lambda\left(0,\theta_{y},\theta_{z}\right) = \begin{bmatrix} COS\left(\theta_{y}\right)COS\left(\theta_{z}\right) & SIN\left(\theta_{z}\right) & -SIN\left(\theta_{y}\right)COS\left(\theta_{z}\right) \\ -COS\left(\theta_{y}\right)SIN\left(\theta_{z}\right) & COS\left(\theta_{z}\right) & SIN\left(\theta_{y}\right)SIN\left(\theta_{z}\right) \\ SIN\left(\theta_{y}\right) & 0 & COS\left(\theta_{y}\right) \end{bmatrix} \\ &\Lambda\left(\theta_{x},0,\theta_{z}\right) = \begin{bmatrix} COS\left(\theta_{z}\right) & COS\left(\theta_{x}\right)SIN\left(\theta_{z}\right) & SIN\left(\theta_{x}\right)SIN\left(\theta_{z}\right) \\ -SIN\left(\theta_{z}\right) & COS\left(\theta_{x}\right)COS\left(\theta_{z}\right) & SIN\left(\theta_{x}\right)COS\left(\theta_{z}\right) \\ 0 & -SIN\left(\theta_{x}\right) & COS\left(\theta_{x}\right) \end{bmatrix} \\ &\Lambda\left(\theta_{x},\theta_{y},0\right) = \begin{bmatrix} COS\left(\theta_{y}\right) & SIN\left(\theta_{x}\right)SIN\left(\theta_{y}\right) & -COS\left(\theta_{x}\right)SIN\left(\theta_{y}\right) \\ 0 & COS\left(\theta_{x}\right) & SIN\left(\theta_{x}\right)SIN\left(\theta_{y}\right) \end{bmatrix} \\ &SIN\left(\theta_{y}\right) & -SIN\left(\theta_{x}\right)COS\left(\theta_{y}\right) & COS\left(\theta_{x}\right)COS\left(\theta_{y}\right) \end{bmatrix} \end{split}$$

KiteAeroDyn Driver

 ${\it Kite Aero Dyn\ Driver\ Input\ File}$

The user specifies the general configuration of the energy kite in the KiteAeroDyn driver input file. The general configuration assumes:

- one fuselage
- two wings (starboard, port) attached to the fuselage
- one vertical stabilizer attached to the fuselage
- two horizontal stabilizers (starboard, port) attached to the vertical stabilizer
- a user-specified number of pylons attached to each wing
- two rotors (top, bottom) per pylon
- nominal circular motion of the energy kite in the port (left) direction

The general configuration of the control surfaces assumes:

- a user-specified number of flaps per wing
- two rudders on the vertical stabilizer
- two elevators per horizontal stabilizer

Commented [JJ2]: This orientation of the energy kite is shown as KiteRoll=0, KitePitch=180, KiteYaw=0.

- · variable rotor speed
- variable rotor-collective blade-pitch angles

The number of pylons/rotors, as well as the undeflected reference point (origin-red nodes in figure above) of each of these energy kite components is specified in a body-fixed (x,y,z) coordinate system in the KiteAeroDyn driver, with x pointed forward (in the primary direction of flight), y pointed starboard (right) (when looking in the primary direction of flight), and z pointed down (following the right-hand rule). (The fuselage reference point is taken to be (0,0,0).) When KiteAeroDyn is coupled within KiteFAST, the reference points are specified within the KiteMBDyn preprocessor. These reference points enable proper spatial mesh-to-mesh mapping between the aerodynamics computed by KiteAeroDyn and the structural dynamics computed by MBDyn. The reference points are added for convenience in defining the geometry of the energy kite; the coordinates of all reference points may be set to (0,0,0) if desired

The user also specifies the ambient horizontal wind speed, including direction and vertical shear, the global rigid-body time-history motion (translational and rotational positions and velocities) and control settings (rotor speeds, rotor collective blade-pitch angles, and flap, rudder, and elevator control settings) of the energy kite. The wind and global motion of the energy kite are specified in a global inertial-frame (X,Y,Z) coordinate system, with X pointed in the nominal 0° wind direction, Z pointed up (opposite gravity), and Y pointed to the left when looking downwind along 0° wind (following the right-hand rule).

Flow chart

Initialization:

Read-in the input file data from the Kite AeroDyn driver input file, and:

- · Convert angular units of input parameters from degrees to radians.
- · Check inputs and set parameters

Call KiteAeroDyn_Init()

Open Output File

Set the reference positions and orientations of the fuselage reference point mesh:

$$\vec{p}^{FusOR} = \vec{0}$$
;
 $\Lambda^{FusOR} = I$

Set mesh-mappings between the fuselage reference point mesh and the KiteAeroDyn input meshes.

$$n = 0$$
$$t = 0$$

Initial calculate output:

Set inputs to KiteAeroDyn at t = 0 (see below for solution at t)

Call KiteAeroDyn_CalcOutput()

Write Output to File

Time increment:

Set the displacement, orientation, and velocities of the fuselage reference point mesh based on the specified motion at $t = t + \Delta t$ (used in the mesh-mappings below):

•
$$\vec{u}^{FusO} = \begin{cases} INTERPID(KitePxi[:], Time[:]@t) \\ INTERPID(KitePyi[:], Time[:]@t) \\ INTERPID(KitePzi[:], Time[:]@t) \end{cases}$$

 $\bullet \quad A^{\textit{FusO}} = A\Big(INTERPID\Big(\textit{KiteRoll}[:],\textit{Time}[:]@t\Big),INTERPID\Big(\textit{KitePitch}[:],\textit{Time}[:]@t\Big),INTERPID\Big(\textit{KiteYaw}[:],\textit{Time}[:]@t\Big)\Big)$

•
$$\vec{v}^{FusO} = \begin{cases} INTERP1D(KiteTVxi[:], Time[:]@t) \\ INTERP1D(KiteTVyi[:], Time[:]@t) \\ INTERP1D(KiteTVzi[:], Time[:]@t) \end{cases}$$

•
$$\vec{\omega}^{FusO} = \frac{\pi}{180} \begin{cases} INTERP1D \left(KiteRVxi[:], Time[:]@t \right) \\ INTERP1D \left(KiteRVyi[:], Time[:]@t \right) \\ INTERP1D \left(KiteRVzi[:], Time[:]@t \right) \end{cases}$$

Set inputs to KiteAeroDyn at t:

•
$$\vec{u}_{j}^{Fus} = M_{u}^{P2L} \left(\vec{u}^{FusO}, \Lambda^{FusO} \right)$$

•
$$\Lambda_j^{Fus} = M_\Lambda^{P2L} \left(\Lambda^{FusO} \right)$$

•
$$\vec{v}_{j}^{Fus} = M_{v}^{P2L} \left(\vec{u}_{j}^{Fus}, \vec{u}^{FusO}, \vec{v}^{FusO}, \vec{\omega}^{FusO} \right)$$

•
$$\vec{V}_{j}^{Fus} = Wind\left(\left\{ \vec{p}_{j}^{FusR} + \vec{u}_{j}^{Fus} \right\} \bullet \hat{Z} \right)$$

Note: The Wind(Z) function used in this equation and several equations below is as follows:

wind (Z) function used in this equation and several equations
$$\begin{aligned}
& \left\{ HWindSpd \left(\frac{Z}{Re\ fHt} \right)^{PL\exp} COS \left(HWindDir \right) \right\} \\
& -HWindSpd \left(\frac{Z}{Re\ fHt} \right)^{PL\exp} SIN \left(HWindDir \right) \right\} \\
& 0
\end{aligned}$$

•
$$\vec{u}_{j}^{SWn} = M_{u}^{P2L} \left(\vec{u}^{FusO}, \Lambda^{FusO} \right)$$

$$\bullet \quad \Lambda_j^{SWn} = M_A^{P2L} \left(\Lambda^{FusO} \right)$$

$$\bullet \quad \vec{v}_{j}^{SWn} = M_{v}^{P2L} \left(\vec{u}_{j}^{SWn}, \vec{u}^{FusO}, \vec{v}^{FusO}, \vec{\omega}^{FusO} \right)$$

•
$$\vec{V}_{j}^{SWn} = Wind\left(\left\{ {}^{In}\vec{p}_{j}^{SWnR} + \vec{u}_{j}^{SWn}\right\} \bullet \hat{Z}\right)$$

KiteAeroDyn

Primary KiteAeroDyn Input File

The undeflected aerodynamic geometry of the components of the energy kite are defined in the primary KiteAeroDyn input file. (Likewise, the undeflected structural geometry of the components of the energy kite are defined in the input file for the KiteMBDyn preprocessor.) For the fuselage, wings, vertical and horizontal stabilizers, and pylons, the aerodynamic nodes define the aerodynamic center of an airfoil (reference point for the airfoil lift and drag forces, which is assumed to be the ¼ chord location within the KiteVSM submodel). The aerodynamic reference line and aerodynamic loads are assumed to be piecewise linear between each node (to establish step changes in loads between nodes—e.g. between nodes with and without control surfaces—would require placing two nodes very close each other).

Each component is specified as follows:

- Fuselage: The locations of the aerodynamic nodes (black nodes in figure above) along the aerodynamic reference line are specified in the body-fixed (x,y,z) coordinate system relative to its origin, with x monotonically increasing (from possibly negative to positive values). The airfoil at each node is assumed to be in the y-z plane, and—along with the nodal locations—the positive aerodynamic twist is specified about positive x, and the chordlength and airfoil table ID are specified. A zero-degree twist means positive y points toward the trailing edge and negative z points toward the suction side of the airfoil.
- Starboard (right) wing: The locations of the aerodynamic nodes (black nodes in figure above) along the aerodynamic reference line (¼ chord) are specified in the body-fixed (x,y,z) coordinate system relative to its origin, with y monotonically increasing. The airfoil at each node is assumed to be rotated from the x-z plane based on the dihedral angle about negative x resulting in an inclined x-z' plane (with y' normal), and—along with the nodal locations—the positive aerodynamic twist is specified about positive y', and the chordlength, airfoil table ID, and flap ID are specified. A zero-degree twist means negative x points toward the trailing edge and negative z' points toward the suction side of the airfoil. Calculations for the lifting line vortex method take place at the midpoints between these nodes; instead of interpolating airfoil data, the airfoil and flap IDs at each midpoint is taken to be the airfoil and flap IDs of the corresponding node with lower y.
- Port (left) wing: The locations of the aerodynamic nodes (black nodes in figure above) along the aerodynamic reference line (¼ chord) are specified in the body-fixed (x,y,z) coordinate system relative to its origin, with y monotonically decreasing (negative values). The airfoil at each node is assumed to be rotated from the x-z plane based on the dihedral angle about positive x resulting in an inclined x-z' plane (with y' normal), and—along with the nodal locations—the positive aerodynamic twist is specified about positive y', and the chordlength, airfoil table ID, and flap ID are specified. A zero-degree twist means negative x points toward the trailing edge and negative z' points toward the suction side of the airfoil. Calculations for the lifting line vortex method take place at the midpoints between these nodes; instead of interpolating airfoil data, the airfoil and flap IDs at each midpoint is taken to be the airfoil and flap IDs of the corresponding node with higher (less negative) y.
- Vertical stabilizer: The locations of the aerodynamic nodes (black nodes in figure above) along the aerodynamic reference line (¼ chord) are specified in the body-fixed (x,y,z) coordinate system relative to its origin, with z monotonically increasing (from possible negative to positive values). The airfoil at each node is assumed to be in the x-y plane, and—along with the nodal locations—the positive aerodynamic twist is specified about positive z, and the chordlength, airfoil table ID, and rudder ID are specified. A zero-degree twist means negative x points toward the trailing edge and positive y points toward the suction side of the airfoil. Calculations for the lifting line vortex method take place at the midpoints between these nodes; instead of interpolating airfoil data, the airfoil and rudder IDs at each midpoint is taken to be the airfoil and rudder IDs of the corresponding node with lower z.
- Starboard (right) horizontal stabilizer: The locations of the aerodynamic nodes (black nodes in figure above) along the aerodynamic reference line (1/4 chord) are specified in the body-fixed (x,y,z) coordinate system relative to its origin, with y monotonically increasing. The airfoil at each node is assumed to be in the x-z plane, and—along with the nodal locations—the positive aerodynamic twist is specified about positive y, and the chordlength, airfoil table ID, and elevator ID are specified. A zero-degree twist means negative x points toward the trailing edge and negative z points toward the suction side of the airfoil. Calculations for the lifting line vortex method take place at the midpoints between these nodes; instead of interpolating

Commented [JJ3]: Not true, could also be monotonically decreasing, but A and B are sent to VSM in order (A is used to control the airfoil); also for output Collocated nodes (i.e. the same x for the fuselage) result in no VSM element (for step changes) (even if y and z are different, there is no element created if the x is the same)

airfoil data, the airfoil and elevator IDs at each midpoint is taken to be the airfoil and elevator IDs of the corresponding node with lower y.

- Port (left) horizontal stabilizer: The locations of the aerodynamic nodes (black nodes in figure above) along the aerodynamic reference line (¼ chord) are specified in the body-fixed (x,y,z) coordinate system relative to its origin, with y monotonically decreasing (negative values). The airfoil at each node is assumed to be in the x-z plane, and—along with the nodal locations—the positive aerodynamic twist is specified about positive y, and the chordlength, airfoil table ID, and elevator ID are specified. A zero-degree twist means negative x points toward the trailing edge and negative z points toward the suction side of the airfoil. Calculations for the lifting line vortex method take place at the midpoints between these nodes; instead of interpolating airfoil data, the airfoil and elevator IDs at each midpoint is taken to be the airfoil and elevator IDs of the corresponding node with higher (less negative) y.
- Pylons: The locations of the aerodynamic nodes (black nodes in figure above) along the aerodynamic reference line (1/4 chord) are specified in the body-fixed (x,y,z) coordinate system relative to its origin, with z monotonically increasing (from possibly negative to positive values). The airfoil at each node is assumed to be in the x-y plane, and—along with the nodal locations—the positive aerodynamic twist is specified about positive z, and the chordlength and airfoil table ID are specified. A zero-degree twist means negative x points toward the trailing edge and positive y points toward the suction side of the airfoil. Calculations for the lifting line vortex method take place at the midpoints between these nodes; instead of interpolating airfoil data, the airfoil ID at each midpoint is taken to be the airfoil ID of the corresponding node with lower z.
- Rotors: Each rotor is in the y-z plane and the origin is coalescent with the hub center. The rotor radius and actuator disk input file are specified.

Inputs	Outputs	States	Parameters
• \vec{u}^{FusO} – Translational displacement	• \vec{u}_i^{Fus} –		• N_{Flaps} – Number of
 (relative) of the fuselage reference point mesh (m) • ū_j^{Fus} - Translational displacement (relative) of the j th node of the fuselage mesh (m) • Λ_j^{Fus} - Displaced rotation (absolute orientation) of the j th node of the fuselage mesh (-) 	Translational displacement (relative) of the j^{th} node of the fuselage mesh (m) • $Out \Lambda_j^{Fus}$ – Displaced rotation (absolute orientation) of the j^{th} node of the fuselage mesh (-)		flaps per wing (-) • N_{Pylons} – Number of pylons per wing (-) • ${}^{ln} \vec{P}_{j}^{FusR}$ – Reference position of the j th node of the fuselage input mesh (m) • ${}^{ln} \Lambda_{j}^{FusR}$ – Reference
 \$\vec{v}_{j}^{Fus}\$ - Translational velocity (absolute) of the \$j\$ th node of the fuselage mesh (m/s) \$\vec{V}_{j}^{Fus}\$ - Undisturbed wind speed computed at the \$j\$ th node of the fuselage i.e. at \[\vec{p}_{j}^{FusR} + \vec{u}_{j}^{Fus} \text{ (m/s)} \] \[• \vec{F}_{j}^{Fus} – Aerodynamic applied concentrated		orientation of the j^{th} node of the fuselage input mesh (-) • ${}^{In}\vec{p}_{j}^{SWnR}$ - Reference position of the j^{th} node of the starboard wing input mesh (m)

of the j th node of the starboard wing	starboard wing mesh		node of the port wing input mesh (m)

Commented [JJ4]: VSM has discrete states.

Commented [jmj5]: Not all parameters are listed here. E.g. DTAero, UseCm, AirDens, etc. are obvious...

Commented [JJ6]: Note that the translational displacements and orientations are fields added to the output load (force and moment) meshes for convenience in the moment-related mesh mappings because the input and output meshes differ.

mesh (m/s)

- \vec{V}_{j}^{SWn} Undisturbed wind speed computed at the j th node of the starboard wing i.e. at ${}^{In}\vec{p}_{i}^{SWnR} + \vec{u}_{i}^{SWn}$ (m/s)
- \$\vec{u}_{j}^{PWn}\$ Translational displacement (relative) of the \$j\$ th node of the port wing mesh (m)

Initialization:

Initialization Inputs	Initialization Outputs
• KAD InFile –	 ρ – Air density
Name of the primary KiteAeroDyn input file (string)	(kg/m^3)
• N_{Flaps} – Number of	
flaps per wing (-) • N_{Pylons} – Number of	
pylons per wing (-)	
• \vec{p}^{SWnOR} – Reference	
position (origin) of the starboard wing (m)	
• \vec{p}^{PWnOR} – Reference	
position (origin) of the port wing (m) • \vec{p}^{VSOR} – Reference	
position (origin) of the	
vertical stabilizer (m) $\vec{p}^{SHSOR} - \text{Reference}$	
position (origin) of the starboard horizontal	
stabilizer (m) • \vec{p}^{PHSOR} – Reference position (origin) of the	
port horizontal stabilizer (m)	
Pstylon n _{pylons} - Reference positions (origins) of pylons on the starboard wing (m)	
• $\vec{p}^{PPyOR} [n_{Pylons}]$ - Reference positions	
(origins) of pylons on the port wing (m) • $\vec{p}^{SPyRtrR} \left[n_{Pylons}, n_2 \right]$	
- Reference positions (origins) of the top and bottom rotors on the	
pylons on the starboard wing (m) • $\vec{p}^{PPyRtrR} \left[n_{Pylons}, n_2 \right]$	
Reference positions (origins) of the top and bottom rotors on the pulpage on the post wing	
pylons on the port wing (m)	

Commented [JJ7]: Greg also added nIfWPts, the number of points where inflow wind is needed.

Note that:

Set parameters from initialization inputs ($N_{\it Flaps}$ and $\,N_{\it Pylons}$). Note that:

• The flap indices: $n_{Flaps} = \{1, 2, ..., N_{Flaps}\}$

• The pylon indices: $n_{Pylons} = \{1, 2, ..., N_{Pylons}\}$

• And: $n_2 = \{1, 2\}$

Read-in the input file data from KAD InFile, and:

• Convert angular units of input parameters from degrees to radians.

• Verify that $FusX_j$, $SWnY_j$, VSZ_j , $SHSY_j$, $SPylZ_j \Big[n_{Pylons} \Big]$ and $PPylZ_j \Big[n_{Pylons} \Big]$ are entered monotonically increasing

• Verify that $PWnY_i$ and $PHSY_i$ are entered monotonically decreasing

• Ensure $\left|SWnDhdrl\right| < \frac{\pi}{2}$ and $\left|PWnDhdrl\right| < \frac{\pi}{2}$

• Check inputs and set parameters

Set the reference positions and orientations of the input line2 meshes:

• Fuselage reference point mesh: $\vec{p}^{FusOR} = \vec{0}$; $\Lambda^{FusOR} = \vec{0}$

• Fuselage:
$$^{ln}\vec{p}_{j}^{FusR} = \begin{cases} FusX_{j} \\ FusY_{j} \\ FusZ_{j} \end{cases};$$

(for
$$j = \{1, 2, ..., NumFusNds\}$$
)
$$\begin{bmatrix} I_{m} A_{j}^{FusR} = \begin{bmatrix} 0 & 0 & -1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{bmatrix} A \left(FusTwist_{j}, 0, 0\right) \end{bmatrix}$$

$$(\text{for } j = \left\{1, 2, \dots, NumSWnNds\right\}) \qquad \begin{bmatrix} In \\ A_j^{SWnR} \end{bmatrix} = \begin{bmatrix} 0 & 0 & -1 \\ -1 & 0 & 0 \\ 0 & 1 & 0 \end{bmatrix} \Lambda \left(-SWnDhdrl, SWnTwist_j, 0\right)$$

$$(\text{for } j = \left\{1, 2, \dots, NumPWnNds\right\}) \qquad \quad ^{ln} A_j^{PWnR} = \begin{bmatrix} 0 & 0 & -I \\ -I & 0 & 0 \\ 0 & I & 0 \end{bmatrix} \Lambda \left(PWnDhdrl, PWnTwist_j, \theta\right)$$

Commented [JJ8]: Note: the 3x3 matrix can also be written as Lambda(0,90deg,0)

Commented [JJ9]: Note: the 3x3 matrix can also be written as Lambda(-90deg,0,90deg)

 ${}^{In}\vec{p}_{j}^{SHSR} = \vec{p}^{SHSOR} + \begin{cases} SHSX_{j} \\ SHSY_{j} \\ SHSZ_{j} \end{cases};$ • Starboard (right) horizontal stabilizer:

(for
$$j = \{1, 2, ..., NumSHSNds\}$$
)
$$\begin{bmatrix} In A_j^{SHSR} = \begin{bmatrix} 0 & 0 & -1 \\ -1 & 0 & 0 \\ 0 & 1 & 0 \end{bmatrix} A(0, SHSTwist_j, 0)$$

• Port (left) horizontal stabilizer:

$$(\text{for } j = \left\{1, 2, \dots, NumPHSNds\right\}) \qquad \quad ^{In} A_j^{PHSR} = \begin{bmatrix} 0 & 0 & -I \\ -I & 0 & 0 \\ 0 & I & 0 \end{bmatrix} \Lambda \left(0, PHSTwist_j, 0\right)$$

 $\begin{bmatrix} In \ \vec{p} \ _{j}^{SPyR} \ [n_{Pylons}\] = \vec{p} \ _{j}^{SPyOR} \ [n_{Pylons}\] + \begin{cases} SPylX_{j} \ [n_{Pylons}\] \\ SPylY_{j} \ [n_{Pylons}\] \\ SPylZ_{j} \ [n_{Pylons}\] \end{cases} ;$ • Starboard (right) pylons :

$$(\text{for } j = \{1, 2, \dots, NumPylNds\}) \qquad \qquad {}^{ln}A_j^{SPyR} \begin{bmatrix} n_{Pylons} \end{bmatrix} = \begin{bmatrix} 0 & 1 & 0 \\ -1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} \Lambda \left(0, 0, SPylTwist_j \begin{bmatrix} n_{Pylons} \end{bmatrix}\right)$$

 $\begin{bmatrix} In \ A_{j}^{SPyR} \begin{bmatrix} n_{Pylons} \end{bmatrix} \end{bmatrix} = \begin{bmatrix} 0 & 1 & 0 \\ -1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} A (0, 0, SPylTwist_{j} \begin{bmatrix} n_{Pylons} \end{bmatrix})$ $In \ \vec{p}_{j}^{PPyR} \begin{bmatrix} n_{Pylons} \end{bmatrix} = \vec{p}^{PPyOR} \begin{bmatrix} n_{Pylons} \end{bmatrix} + \begin{cases} PPylX_{j} \begin{bmatrix} n_{Pylons} \end{bmatrix} \\ PPylY_{j} \begin{bmatrix} n_{Pylons} \end{bmatrix} \end{cases};$ $PPylZ_{j} \begin{bmatrix} n_{Pylons} \end{bmatrix}$ • Port (left) pylons:

$$(\text{for } j = \left\{1, 2, \dots, NumPylNds\right\}) \qquad \qquad {}^{ln}A_{j}^{PPyR} \begin{bmatrix} n_{Pylons} \end{bmatrix} = \begin{bmatrix} 0 & 1 & 0 \\ -1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} A \left(0, 0, PPylTwist_{j} \begin{bmatrix} n_{Pylons} \end{bmatrix}\right)$$

Set the reference positions and orientations of the output point meshes to be the midpoints of the input meshes (there is one fewer output node than there are input nodes):

Commented [JJ10]: Note: the 3x3 matrix can also be written as Lambda(0,0,90deg)

Commented [JJ11]: Note: the 3x3 matrix can also be written as Lambda(-90deg,0,90deg)

Commented [JJ12]: Note: the 3x3 matrix can also be written as

• Fuselage:
$$O^{\text{not}} \vec{p}_{j}^{FistR} = \frac{1}{2} \left\{ \begin{bmatrix} FusX_{j} \\ FusY_{j} \\ FusY_{j} \\ FusZ_{j} \end{bmatrix} + \begin{bmatrix} FusX_{j+1} \\ FusY_{j+1} \\ FusZ_{j+1} \end{bmatrix} \right\};$$

$$(\text{for } j = \{1, 2, ..., NumFusNds - 1\}) \quad o^{\text{not}} A_{j}^{FistR} = \begin{bmatrix} 0 & 0 & -1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{bmatrix} A \left\{ \frac{1}{2} \left\{ FusTwist_{j} + FusTwist_{j+1} \right\}, 0, 0 \right\}$$

Set the reference positions and orientations of the input/output point meshes for the top and bottom rotors on the pylons:

$$\bullet \ \ \, \text{on the starboard (right) wing:} \qquad \qquad \vec{p}^{\mathit{SPyRtrR}}\left[\,n_{\mathit{Pylons}},n_2^{}\,\right] = \text{(from initialization input)};$$

$$\Lambda^{SPyRtrR} \left[n_{Pylons}, n_2 \right] = I$$

• on the port (left) wing:
$$\vec{p}^{PPyRtrR} \left[n_{Pylons}, n_2 \right] = \text{(from initialization input)};$$

$$\Lambda^{PPyRtrR} \left[n_{Pylons}, n_2 \right] = I$$

Call ActuatorDisk Init()

Set the KiteVSM initialization inputs:

- Chord Defined per element as the averaged chord between adjacent analysis nodes
- Length Defined per element as the absolute x distance between adjacent analysis nodes for the fuselage, the absolute y distance between adjacent analysis nodes divided by the COSine of the averaged dihedral angle for the wings (starboard, port), the absolute y distance between adjacent analysis nodes for the horizontal stabilizers (starboard, port), and the absolute z distance for the vertical stabilizer and pylons (starboard, port)
- AirfoilID Defined per element as the airfoil ID with the smallest x for the fuselage, the smallest y for the starboard wing and horizontal stabilizer, the largest y for the port wing and stabilizer, and the smallest z for the vertical stabilizer and pylons (starboard, port) (instead of interpolating)
- LiftMod Lifting-line calculation model (-) (switch) {1:geometric AoA, 2:vortex-step method}
- VSMMod Trailing vortices alignment model (-) (switch) {1:chord, 2: local free stream}
- VSMToler Tolerance in the Newton iterations (m²/s) or DEFAULT
- VSMMaxIter Maximum number of Newton iterations (-) or DEFAULT
- VSMPerturb Perturbation size for computing the Jacobian in the Newton iterations (m²/s) or DEFAULT

Call KiteVSM_Init()

Write the KiteAeroDyn summary file if SumPrint = True:

PUT SOMETHING HERE

Open the KiteAeroDyn output file if OutSwtch = 1 or 3.

Update States

Set the KiteVSM inputs at $t + \Delta t$ as follows:

• Global locations of element endpoints (A and B) – set per element:

Commented [JJ13]: I'm assuming KiteVSM also solves the LiftMod=1 case

Commented [JJ14]: ABS(y_j+1 - y_j)/COS(0.5*(Dihedral_j + Dihedral j+1))

Commented [JJ15]: We need to set the DEFAULTs.

Commented [JJ16]: We need to set the DEFAULTs

Commented [JJ17]: We need to set the DEFAULTs.

Commented [jmj18]: Greg has implemented a start of the summary file with the VSM elements, Ax,y,z, Bx,y,z

Commented [JJ19]: Note: KiteVSM does not strictly follow the framework because KiteVSM_UpdateStates() only has one set of inputs at t+dt.

Commented [JJ20]: KiteVSM needs a way to distinguish between the fuselage and other members because the circulation should be zero on the fuselage.<--The actual implementation separates the fuselage from the other members in some way.

 $+(NumPylNds-I)(n_{Pylons}-I)$

$$\begin{array}{ll} \vec{p}_{j+NumFunNds-1}^{B} & = & ^{ln} \vec{p}_{j+l}^{PPyR} \left[n_{Pylons} \right] + \vec{u}_{j+l}^{PPy} \left[n_{Pylons} \right] & \text{(for } j = \{1,2,\ldots,NumPylNds-1\}) \\ & + NumSNNds-1 \\ & + NumSNNds-1 \\ & + NumSNNds-1 \\ & + NumSNNds-1 \\ & + (NumPylNds-1)(n_{pom}-1) \\ & \text{(for } j = \{1,2,\ldots,NumFusNds-1\}) \\ & \text{(NumPylNds-1)}(n_{pom}-1) \\ & \text{(for } j = \{1,2,\ldots,NumFusNds-1\}\}) \\ & \text{Rel } \vec{V}_j + NumFusNds-1 \\ & = \frac{1}{2} \left(\vec{V}_j^{FWs} + \vec{V}_{j+l}^{FWs} \right) - \frac{1}{2} \left(\vec{v}_j^{FWs} + \vec{v}_{j+l}^{FWs} \right) \\ & \text{(for } j = \{1,2,\ldots,NumFusNds-1\}\}) \\ & \text{Rel } \vec{V}_j + NumFusNds-1 \\ & + NumSNnNds-1 \\ & = \frac{1}{2} \left(\vec{V}_j^{FWs} + \vec{V}_{j+l}^{FWs} \right) - \frac{1}{2} \left(\vec{v}_j^{FWs} + \vec{v}_{j+l}^{FWs} \right) \\ & \text{(for } j = \{1,2,\ldots,NumSWnNds-1\}\}) \\ & \text{Rel } \vec{V}_j + NumFusNds-1 \\ & + NumSNnNds-1 \\ & + NumNSNnNds-1 \\ & + NumNNnNds-1 \\ & + NumNnNds-1 \\ & + NumNNnNds-1 \\ & + NumNnNds-1 \\ & + NumNnnNds-1 \\ & + NumNnnn-1 \\ & + NumNnnnn-1 \\ & + NumNnnn$$

 $= {}^{In}\vec{p}_{i+1}^{PPyR} \lceil n_{Pvlons} \rceil + \vec{u}_{i+1}^{PPy} \lceil n_{Pvlons} \rceil \quad \text{(for } j = \{1, 2, \dots, NumPylNds - 1\})$

Commented [JJ21]: To do these Line2-to-Point mesh mappings, the orientation field can be added to a MiscVar that is a Sibling of the output mesh.

$$\begin{array}{ll} Out & A_{j+NumFusNds-1} = M_A^{L2P} \left(A^{VS} \right) & \text{(for } j = \{1,2,\ldots,NumVSNds-1\} \text{)} \\ & + NumSw_nNds-1 \\ & + NumPw_nNds-1 \\ & + NumFusNds-1 \\ & + NumFw_nNds-1 \\ & + NumPw_nNds-1 \\ & + NumPw_nNds-1 \\ & + NumPw_nNds-1 \\ & + NumPw_nNds-1 \end{array}$$

(for $j = \{1, 2, ..., NumFusNds - 1\}$)

(for $j = \{1, 2, ..., NumSWnNds - 1\}$)

(for $j = \{1, 2, \dots, NumPWnNds - I\}$)

• Aerodynamic + elastic twist – set per element:

 $^{Out}\Lambda_{j+NumFusNds-1}=M_{\Lambda}^{L2P}\left(\Lambda^{SWn}\right)$

 ${}^{Out}_{\underset{+NumFusNds-1}{j+NumFusNds-1}} = M_{\Lambda}^{L2P} \left(\Lambda^{PWn} \right)$

 $^{Out}\Lambda_i = M_{\Lambda}^{L2P} \left(\Lambda^{Fus} \right)$

$$\begin{array}{ll} \textit{Out} \ A_{j+NumFusNds-1} &= M_A^{L2P} \left(A^{PHS}\right) & \text{ (for } j = \{1,2,\ldots,NumPHSNds-1\}) \\ &+ NumSusNds-1 &+ NumPusNds-1 &+ NumSusNds-1 &+ NumSusNds-1 &+ NumSusNds-1 &+ NumSusNds-1 &+ NumPusNds-1 &+ NumPusNd$$

• Control settings – Defined per element as the control setting with the smallest y for the starboard wing and horizontal stabilizer, the largest y for the port wing and stabilizer, and the smallest z for the vertical stabilizer (instead of interpolating)

Call KiteVSM UpdateStates()

No need to call ActuatorDisk_UpdateStates(), as this is blank anyway...

Calculate Output

Calculate the output-mesh motions of the fuselage, wings, vertical stabilizer, horizontal stabilizers, and pylons via mesh mapping:

$$\begin{split} & {}^{Out}\vec{u}_{j}^{Fus} = M_{u}^{L2P}\left(\vec{u}_{j}^{Fus}, \Lambda_{j}^{Fus}\right) \\ & {}^{Out}A_{j}^{Fus} = M_{A}^{L2P}\left(A_{j}^{Fus}\right) \\ & {}^{Out}A_{j}^{SWn} = M_{u}^{L2P}\left(\vec{u}_{j}^{SWn}, \Lambda_{j}^{SWn}\right) \\ & {}^{Out}\vec{u}_{j}^{SWn} = M_{A}^{L2P}\left(A_{j}^{SWn}\right) \\ & {}^{Out}A_{j}^{SWn} = M_{A}^{L2P}\left(A_{j}^{SWn}\right) \\ & {}^{Out}\vec{u}_{j}^{PWn} = M_{u}^{L2P}\left(\vec{u}_{j}^{PWn}, \Lambda_{j}^{PWn}\right) \\ & {}^{Out}A_{j}^{PWn} = M_{A}^{L2P}\left(A_{j}^{PWn}\right) \\ & {}^{Out}\vec{u}_{j}^{VS} = M_{u}^{L2P}\left(\vec{u}_{j}^{VS}, \Lambda_{j}^{VS}\right) \\ & {}^{Out}A_{j}^{VS} = M_{A}^{L2P}\left(\vec{u}_{j}^{VS}, \Lambda_{j}^{SHS}\right) \\ & {}^{Out}\vec{u}_{j}^{SHS} = M_{u}^{L2P}\left(\vec{u}_{j}^{SHS}, \Lambda_{j}^{SHS}\right) \\ & {}^{Out}A_{j}^{SHS} = M_{A}^{L2P}\left(A_{j}^{SHS}\right) \\ & {}^{Out}\vec{u}_{j}^{PHS} = M_{u}^{L2P}\left(\vec{u}_{j}^{PHS}, \Lambda_{j}^{PHS}\right) \\ & {}^{Out}A_{j}^{PHS} = M_{A}^{L2P}\left(A_{j}^{PHS}\right) \\ & {}^{Out}A_{j}^{SPy}\left[n_{Pylons}\right] = M_{u}^{L2P}\left(\vec{u}_{j}^{SPy}\left[n_{Pylons}\right]\right) \\ & {}^{Out}A_{j}^{SPy}\left[n_{Pylons}\right] = M_{u}^{L2P}\left(A_{j}^{SPy}\left[n_{Pylons}\right]\right) \\ & {}^{Out}A_{j}^{SPy}\left[n_{Pylons}\right] = M_{A}^{L2P}\left(A_{j}^{SPy}\left[n_{Pylons}\right]\right) \\ & {}^{Out}A_{j}^{SPy}\left[n_{Pylons}\right] = M_{A}^{Du}\left(A_{j}^{SPy}\left[n_{Pylons}\right]\right) \\ & {}^{Out}$$

Calculate the aerodynamic loads on the fuselage, wings, vertical stabilizer, horizontal stabilizers, and pylons as

- Set the KiteVSM inputs as in Update States above
- Call KiteVSM_CalcOutput()
- Transfer the aerodynamic loads—per element—calculated by KiteVSM to the KiteAeroDyn output mesh:

$$\vec{F}_{j}^{Fus} = \vec{F}_{j} \quad \text{and} \quad \vec{M}_{j}^{Fus} = \vec{M}_{j} \qquad (\text{for } j = \{1, 2, ..., NumFusNds - I\})$$

$$\vec{F}_{j}^{SWn} = \vec{F}_{j+NumFusNds-I} \quad \text{and} \quad \vec{M}_{j}^{SWn} = \vec{M}_{j+NumFusNds-I} \qquad (\text{for } j = \{1, 2, ..., NumSWnNds - I\})$$

$$\vec{F}_{j}^{PWn} = \vec{F}_{j+NumFusNds-I} \quad \text{and} \quad \vec{M}_{j}^{PWn} = \vec{M}_{j+NumFusNds-I} \qquad (\text{for } j = \{1, 2, ..., NumPWnNds - I\})$$

$$\vec{F}_{j}^{VS} = \vec{F}_{j+NumFusNds-I} \quad \text{and} \quad \vec{M}_{j}^{VS} = \vec{M}_{j+NumFusNds-I} \qquad (\text{for } j = \{1, 2, ..., NumPWnNds - I\})$$

$$\vec{F}_{j}^{SHS} = \vec{F}_{j+NumFusNds-I} \quad \text{and} \quad \vec{M}_{j}^{VS} = \vec{M}_{j+NumFusNds-I} \qquad (\text{for } j = \{1, 2, ..., NumPWnNds - I\})$$

$$\vec{F}_{j}^{SHS} = \vec{F}_{j+NumFusNds-I} \quad \text{and} \quad \vec{M}_{j}^{SHS} = \vec{M}_{j+NumFusNds-I} \qquad (\text{for } j = \{1, 2, ..., NumVSNds - I\})$$

$$\vec{F}_{j}^{SHS} = \vec{F}_{j+NumFusNds-I} \quad \text{and} \quad \vec{M}_{j}^{SHS} = \vec{M}_{j+NumFusNds-I} \qquad (\text{for } j = \{1, 2, ..., NumSHSNds - I\})$$

$$\vec{F}_{j}^{PHS} = \vec{F}_{j+NumFusNds-I} \quad \text{and} \quad \vec{M}_{j}^{PHS} = \vec{M}_{j+NumFusNds-I} \qquad \text{for } j = \{1, 2, ..., NumPHSNds - I\})$$

$$\vec{F}_{j}^{SP} [n_{pylons}] = \vec{F}_{j+NumFusNds-I} \quad \text{humSHSNds-I} \quad \text{humSHSNds-I$$

Calculate the aerodynamic rotor loads as follows:

IF (RotorMod = 1) THEN

The calculations below are in a loop for $n_{Pylons} = \{1, 2, ..., N_{Pylons}\}$ and $n_2 = \{1, 2\}$. Also the calculations for the rotors on the starboard wing should be repeated for the rotors on the port wing.

Set inputs to ActuatorDisk:

•
$$\Omega = \Omega^{SPyRtr} \left[n_{Pylons}, n_2 \right]$$

•
$$\theta = \theta^{SPyRtr} \left[n_{Pylons}, n_2 \right]$$

•
$$\theta = \theta^{SPyRtr} \begin{bmatrix} n_{Pylons}, n_2 \end{bmatrix}$$

• $V^{Rel} = \begin{bmatrix} Rel \vec{V}^{SPyRtr} \begin{bmatrix} n_{Pylons}, n_2 \end{bmatrix} \end{bmatrix}_2$

$$\bullet \quad \chi = \begin{cases} 0 & for\left(V^{Rel} = 0\right) \\ ACOS\left(\frac{Rel \ \vec{V}^{SPyRtr} \left[n_{Pylons}, n_{2}\right] \bullet \hat{x}^{SPyRtr} \left[n_{Pylons}, n_{2}\right]}{V^{Rel}}\right) & otherwise \end{cases}$$
 where:
$${}^{Rel \ \vec{V}^{SPyRtr} \left[n_{Pylons}, n_{2}\right] = \vec{V}^{SPyRtr} \left[n_{Pylons}, n_{2}\right] - \vec{V}^{SPyRtr} \left[n_{Pylons}, n_{2}\right]}$$

Call ActuatorDisk_CalcOutput()

Set KiteAeroDyn outputs related to the rotors:

•
$$\vec{F}^{SPyRtr} [n_{Pylons}, n_2] = [\Lambda^{Disk} [n_{Pylons}, n_2]]^T \begin{cases} F_x \\ F_y \\ F_z \end{cases}$$

•
$$\vec{M}^{SPyRtr} [n_{Pylons}, n_2] = [A^{Disk} [n_{Pylons}, n_2]]^T \begin{cases} M_x \\ M_y \\ M_z \end{cases}$$

where a local disk coordinate system is defined such that $\hat{x}^{Disk} \left[n_{Pylons}, n_2 \right]$ is normal to the disk, $\hat{y}^{Disk} \left[n_{Pylons}, n_2 \right] / \hat{z}^{Disk} \left[n_{Pylons}, n_2 \right]$ are in the disk, ${}^{Rel} \vec{V}^{SPyRtr} \left[n_{Pylons}, n_2 \right]$ is in the $\hat{x}^{Disk} \left[n_{Pylons}, n_2 \right] / \hat{y}^{Disk} \left[n_{Pylons}, n_2 \right]$ plane with positive ${}^{Rel} \vec{V}^{SPyRtr} \left[n_{Pylons}, n_2 \right]$ along negative $\hat{y}^{Disk} \left[n_{Pylons}, n_2 \right]$, and $\hat{z}^{Disk} \left[n_{Pylons}, n_2 \right]$ is normal to this plane as follows:

$$\begin{bmatrix} \hat{\mathbf{z}}^{\mathrm{Out}} \\ \hat{\mathbf{y}}^{\mathrm{Out}} \\ \hat{\mathbf{y}}^{\mathrm{Out}} \end{bmatrix} = \begin{bmatrix} \hat{\mathbf{z}}^{\mathrm{Out}} \\ \hat{\mathbf{z}}^{\mathrm{Out}} \\ \hat{\mathbf{y}}^{\mathrm{Out}} \end{bmatrix} \begin{bmatrix} n_{\mathrm{Sims}}, n_2 \end{bmatrix} = \begin{bmatrix} \hat{\mathbf{z}}^{\mathrm{Out}} \\ \hat{\mathbf{z}}^{\mathrm{Out}} \\ \hat{\mathbf{y}}^{\mathrm{Out}} \end{bmatrix} \begin{bmatrix} n_{\mathrm{Sims}}, n_2 \end{bmatrix} = \begin{bmatrix} \hat{\mathbf{z}}^{\mathrm{Out}} \\ \hat{\mathbf{z}}^{\mathrm{Out}} \end{bmatrix} \begin{bmatrix} \hat{\mathbf{z}}^{\mathrm{Out}} \\ \hat{\mathbf{z}}^{\mathrm{Out}} \end{bmatrix} \begin{bmatrix} n_{\mathrm{Sims}}, n_2 \end{bmatrix} = 0$$

ELSE

The calculations below are in a loop for $n_{Pylons} = \{1, 2, ..., N_{Pylons}\}$ and $n_2 = \{1, 2\}$. Also the calculations for the rotors on the starboard wing should be repeated for the rotors on the port wing.

Set KiteAeroDyn outputs related to the rotors:

•
$$\vec{F}^{SPyRtr} \left[n_{Pylons}, n_2 \right] = \vec{0}$$

•
$$\vec{M}^{SPyRtr} \left[n_{Pylons}, n_2 \right] = \vec{0}$$

END IF

Calculate the write outputs and write outputs to a file as follows:

This is a list of all possible output parameters available within the KiteAeroDyn module. The names are grouped by meaning, but can be ordered in the OUTPUTS section of the KiteAeroDyn input file as you see fit.

Fus β refers to output node β on the fuselage, where β is a one-digit number in the range [1,9] corresponding to the center of the element where entry β in the **FusOutNd** list defines the endpoint with the smallest x. Setting $\beta > NFusOuts$ yields invalid output.

SWn β and PWn β refer to output node β on the starboard and port wings, respectively, where β is a one-digit number in the range [1,9] corresponding to the center of the element where entry β in the *SWnOutNd* and *PWnOutNd* lists define the endpoints with the smallest y and largest y, respectively. Setting $\beta > NSWnOuts$ and *NPWnOuts*, respectively, yields invalid output. SFlp α and PFlp α refer to flap α on the starboard and port wings, respectively, where α is a one-digit number in the range [1,9]. If *NumFlaps* > 9, only the first 9 flaps can be output.

VS β refers to output node β on the vertical stabilizer, where β is a one-digit number in the range [1,9] corresponding to the center of the element where entry β in the *VSOutNd* list defines the endpoint with the smallest z. Setting $\beta > NVSOuts$ yields invalid output. Rudra refers to rudder α on the vertical stabilizer, where α is a one-digit number in the range [1,2].

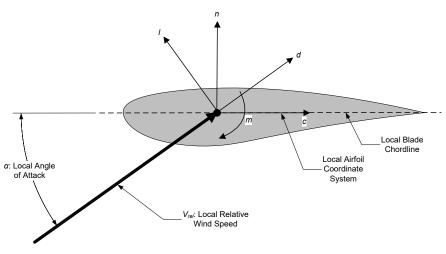

SHS β and PHS β refer to output node β on the starboard and port horizontal stabilizers, respectively, where β is a one-digit number in the range [1,9] corresponding to the center of the element where entry β in the **SHSOutNd** and **PHSOutNd** lists define the endpoints with the smallest y and largest y, respectively. Setting $\beta > NSHSOuts$ and **NPHSOuts**, respectively, yields invalid output. SElv α and PElv α refer to elevator α on the starboard and port horizontal stabilizers, respectively, where α is a one-digit number in the range [1,2].

SPα and PPα refer to pylon α on the starboard and port wings, respectively, where α is a one-digit number in the range [1,9]. SPαβ and PPαβ refer to output node β on pylon α on the starboard and port wings, respectively, where α is a one-digit number in the range [1,9] and β is a one-digit number in the range [1,9] corresponding to the center of the element where entry β in the *PylOutNd* list defines the endpoint with the smallest z. Setting α > *NumPylons* or setting β > *NPylOuts* yields invalid output. If *NumPylons* > 9, only the first 9 pylons can be output.

For the fuselage, wings, vertical stabilizer, horizontal stabilizers, and pylons, the local airfoil coordinate system, including the local angle of attack and force components, is shown below. The spanwise (s) axis is not shown, but is directed into the page following the right-hand rule i.e. $s = n \times c$, where n is normal to the chord pointed toward the suction surface and c is along the chord pointed toward the trailing edge.

Commented [JJ22]: Because the outputs are based on the centers of the elements, and not the element end points, the FusOutNd list cannot contain node NumFusNds. Likewise for the wings, stabilizers, and pylons.

Commented [JJ23]: The local coordinate system in KiteVSM has x=n, y=c, and z=s.

Channel Name(s)	Unit(s)	Description
Fuselage		
FusβVAmbn, FusβVAmbc, FusβVAmbs	(m/s), (m/s), (m/s)	Ambient wind velocity at Fusβ in the local airfoil coordinate system

KitePwr = P^{SPyRtr} \left[ n_{Pylons}, n_2 \right] + P^{PPyRtr} \left[ n_{Pylons}, n_2 \right]
```

Actuator Disk (MODULE Actuator Disk)

Solves quasi-steady actuator disk to calculate the 3 forces/3 moments/power dependent on the rotor speed (Ω), rotor inflow relative wind speed (vector magnitude V^{Rel}), rotor inflow skew angle (χ), and rotor-collective bladepitch angle (θ).

Note: The actuator disk is defined with local x normal to the disk (pointed forward, in the primary direction of flight) and positive rotation (Ω) about positive local x. The V^{Rel} vector is always in the local x-y plane, and unless χ is 0° or 180°, the V^{Rel} vector has a component along negative local y. Local z follows the right-hand rule. (That is, the local coordinate system rotates with the V^{Rel} vector.)

Inputs	Outputs	States	Parameters
 Ω - Rotor speed (rad/s) V^{Rel} - Rotor inflow relative wind speed (ambient + kite motion) (vector magnitude) (m/s) χ - Rotor inflow-skew angle (rad) θ - Rotor-collective blade-pitch angle (rad) 	 F_x - Thrust (x/axial) force (N) F_y - Transverse (y) force (N) F_z - Transverse (z) force (N) M_x - Torque (x) (Nm) M_y - Transverse (y) moment (Nm) M_z - Transverse (z) moment (Nm) P - Power (W) 		 D – Rotor diameter (m) N_{RtSpd} – Number of rotor speeds in tables (-) N_{V Rel} – Number of rotor inflow wind speeds in tables (-) N_χ – Number of rotor inflow-skew angles in tables (-) N_θ – Number of rotor-collective blade-pitch angles in tables (-) RtSpd [n_{RtSpd}] – Rotor speeds in tables (rad/s) V Rel [n_{V Rel}] – Rotor inflow wind speeds in tables

Initialization:

Initialization Inputs	Initialization Outputs
• R – Rotor radius (m)	
 ρ – Air density 	
(kg/m^3)	
• FileName - File	
name (including path)	
of the actuator disk	
input file (string)	

Set parameters from initialization inputs (D = 2R)

Read in parameters from FileName (N_{RtSpd} , N_{VRel} , N_{χ} , N_{θ} , $RtSpd\left[n_{RtSpd}\right]$, $VRel\left[n_{VRel}\right]$, $\chi\left[n_{\chi}\right]$, $\theta\left[n_{\theta}\right]$, $C_{Fx}\left[n_{RtSpd},n_{VRel},n_{\chi},n_{\theta}\right]$, $C_{Fy}\left[n_{RtSpd},n_{VRel},n_{\chi},n_{\theta}\right]$, $C_{Fz}\left[n_{RtSpd},n_{VRel},n_{\chi},n_{\theta}\right]$, $C_{Mx}\left[n_{RtSpd},n_{VRel},n_{\chi},n_{\theta}\right]$, $C_{Mz}\left[n_{RtSpd},n_{VRel},n_{\chi},n_{\theta}\right]$, $C_{Mz}\left[n_{RtSpd},n_{VRel},n_{\chi},n_{\theta}\right]$, $C_{Mz}\left[n_{RtSpd},n_{VRel},n_{\chi},n_{\theta}\right]$, $C_{Mz}\left[n_{RtSpd},n_{VRel},n_{\chi},n_{\theta}\right]$, $C_{P} \left[n_{RtSpd} \,, n_{VRel} \,, n_{\chi} \,, n_{\theta} \right]).$

Convert units of $\theta[n_{\theta}]$ and $\chi[n_{\chi}]$ from degrees to radians.

Note/verify restrictions on input data:

- 0 < R.
- $\theta < \rho$.
- $2 \le N_{RtSpd}$; must be the same for each table; note: $1 \le n_{RtSpd} \le N_{RtSpd}$.
- $2 \le N_{VRel}$; must be the same for each table; note: $1 \le n_{VRel} \le N_{VRel}$.
- $2 \le N_\chi$; must be the same for each table; note: $1 \le n_\chi \le N_\chi$.
- $2 \leq N_{\theta}$; must be the same for each table; note: $1 \leq n_{\theta} \leq N_{\theta}$.
- $RtSpd [n_{RtSpd}]$; data must be entered monotonically increasing.
- $0 \le V \ Re \ l \ [n_{VRel}]$; data must be entered monotonically increasing.
- $0 \le \chi \lceil n_{_{\gamma}} \rceil \le \pi$ (radians); data must be entered monotonically increasing.
- $-\pi \le \theta [n_{\theta}] \le \pi$ (radians); data must be entered monotonically increasing

Commented [JJ32]: Don't need to have lower and upper

Update States: Blank.

Calculate Outputs:

Trigger a fatal error if:
$$\left(\left(\Omega < RtSpd \left[I \right] \right).OR. \left(\Omega > RtSpd \left[N_{RtSpd} \right] \right) \right),$$

$$\left(\left(V^{Rel} < V \ Re \ l \left[I \right] \right).OR. \left(V^{Rel} > V \ Re \ l \left[N_{V \ Re \ l} \right] \right) \right),$$

$$\left(\left(\left(\chi < \chi \left[I \right] \right).OR. \left(\chi > \chi \left[N_{\chi} \right] \right) \right),$$
 or
$$\left(\left(\theta < \theta \left[I \right] \right).OR. \left(\theta > \theta \left[N_{\theta} \right] \right) \right).$$

Calculate the outputs via 4D interpolation:

$$\begin{split} F_{x} &= INTERP4D \Bigg(\rho D^{4} \Bigg(\frac{\Omega}{2\pi} \Bigg)^{2} C_{Fx} \big[\vdots, \vdots, \vdots, \vdots \big], RtSpd \big[\vdots \big] @ \Omega, V \ Rel \big[\vdots \big] @ V^{Rel}, \chi \big[\vdots \big] @ \chi, \theta \big[\vdots \big] @ \theta \Bigg) \\ F_{y} &= INTERP4D \Bigg(\rho D^{4} \Bigg(\frac{\Omega}{2\pi} \Bigg)^{2} C_{Fy} \big[\vdots, \vdots, \vdots, \vdots \big], RtSpd \big[\vdots \big] @ \Omega, V \ Rel \big[\vdots \big] @ V^{Rel}, \chi \big[\vdots \big] @ \chi, \theta \big[\vdots \big] @ \theta \Bigg) \\ F_{z} &= INTERP4D \Bigg(\rho D^{4} \Bigg(\frac{\Omega}{2\pi} \Bigg)^{2} C_{Fz} \big[\vdots, \vdots, \vdots, \vdots \big], RtSpd \big[\vdots \big] @ \Omega, V \ Rel \big[\vdots \big] @ V^{Rel}, \chi \big[\vdots \big] @ \chi, \theta \big[\vdots \big] @ \theta \Bigg) \\ M_{x} &= INTERP4D \Bigg(\rho D^{5} \Bigg(\frac{\Omega}{2\pi} \Bigg)^{2} C_{Mx} \big[\vdots, \vdots, \vdots, \vdots \big], RtSpd \big[\vdots \big] @ \Omega, V \ Rel \big[\vdots \big] @ V^{Rel}, \chi \big[\vdots \big] @ \chi, \theta \big[\vdots \big] @ \theta \Bigg) \\ M_{y} &= INTERP4D \Bigg(\rho D^{5} \Bigg(\frac{\Omega}{2\pi} \Bigg)^{2} C_{My} \big[\vdots, \vdots, \vdots, \vdots \big], RtSpd \big[\vdots \big] @ \Omega, V \ Rel \big[\vdots \big] @ V^{Rel}, \chi \big[\vdots \big] @ \chi, \theta \big[\vdots \big] @ \theta \Bigg) \\ M_{z} &= INTERP4D \Bigg(\rho D^{5} \Bigg(\frac{\Omega}{2\pi} \Bigg)^{2} C_{Mz} \big[\vdots, \vdots, \vdots, \vdots \big], RtSpd \big[\vdots \big] @ \Omega, V \ Rel \big[\vdots \big] @ V^{Rel}, \chi \big[\vdots \big] @ \chi, \theta \big[\vdots \big] @ \theta \Bigg) \end{aligned}$$

Commented [jmj33]: I'd prefer this to use the 4D isoparametric interpolation that is currently used in InflowWind

 $P = INTERP4D \left(\rho D^{5} \left(\frac{\Omega}{2\pi} \right)^{3} C_{p} [:,:,:,:], RtSpd [:]@\Omega, VRel [:]@V^{Rel}, \chi [:]@\chi, \theta [:]@\theta \right)$
